

Contribution Statement

Team:	Binary	Topic:	Topic 4 – Async Research Assistant
Repository:	https://github.com/mrorxan/research-assistant	Final tag:	v1.0-final
Date:	July 29, 2026	Members:	Orkhan Aliyev, Habil Huseynov

How the work was divided

The project was split chronologically into two halves of comparable size. Orkhan built the foundation and the service layer: everything from the project scaffold up to and including the tested wrappers around the provided `ai/` package. At that point the work was handed over, and Habil composed those pieces into the concurrent application and shipped it: orchestration, business flow, CLI, scripts, containerisation, and CI. Documentation was split the same way, each member writing the sections that cover his own code. Both halves went through pull requests reviewed and approved by the other member.

Member A — Orkhan Aliyev (@mrorxan)

Owned (sole author of these files and pull requests):

- Project scaffold: the provided `ai/`, `data/` and smoke tests copied in unchanged; `.gitignore`, `.env.example`, `pytest.ini`, `requirements.txt`, `initial pyproject.toml`
- `researcher/config.py`, `researcher/models.py`
- `researcher/storage/cache_store.py`, `researcher/telemetry/cost.py`
- `researcher/services/ai_service.py`, `researcher/services/cache.py`
- `tests/test_config.py`, `test_models.py`, `test_cache_store.py`, `test_cost.py`, `test_ai_service.py`, `test_cache.py`
- SE-layer fixtures added to `tests/conftest.py` (provided smoke-test fixtures kept unchanged)
- Report: Executive Summary and sections 1, 2, 4, 5; slides 1–5
- README: quick start, CLI, environment variables, architecture, project layout
- Compiled deliverables (report, slides, this statement) and the `v1.0-final` tag
- Pull requests: #1, #2, #3, #4, #11, #13, #14

Co-owned: `tests/conftest.py` (shared fixtures later consumed by Habil's tests).

Reviewed and approved: all of Habil's pull requests (#5–#10, #12) covering the orchestrator, failover, researcher flow and CLI, scripts and artefacts, Docker and CI, architecture documentation, and his documentation half.

Approximate share of commits: 50 %

Member B — Habil Huseynov (@Habil7)

Owned (sole author of these files and pull requests):

- `researcher/concurrency/orchestrator.py`
- `researcher/core/researcher.py`, `researcher/cli.py`, `researcher/__main__.py`
- `researcher/services/failover.py`
- `scripts/demo.py` and `scripts/bench.py`
- Measured run artefacts: `artefacts/bench.json`, `artefacts/demo_run.json`
- Dockerfile, `.dockerignore`, `requirements-dev.txt`, `.github/workflows/ci.yml`, `ruff` and `mypy` configuration
- `tests/test_orchestrator.py`, `test_researcher.py`, `test_cli.py`, `test_end_to_end.py`, `test_failover.py`
- `docs/architecture.md`
- Report: sections 3, 6, 7, 8, 9, Tools & Acknowledgements, Appendix; slides 6–10
- README: Docker, tests, benchmark, live demo, limitations, tools
- Pull requests: #5, #6, #7, #8, #9, #10, #12

Co-owned: `tests/conftest.py` (consumer of the shared fixtures).

Reviewed and approved: all of Orkhan's pull requests (#1–#4, #11, #13, #14) covering the scaffold, configuration and models, cache store and telemetry, the service layer, his documentation half, and the compiled deliverables.

Approximate share of commits: 50 %

AI tool disclosure

We used Claude (Anthropic) as an AI coding assistant throughout the project, in the way the course brief permits: as a collaborator, not a ghostwriter.

Module / area	Assistant	What the team did with it
SE-layer modules (<code>researcher/</code>)	Claude	Drafted against the architecture and policies we specified; every file reviewed, adjusted, and verified by running the suite and live calls before commit.
Test suite	Claude	Drafted test cases per module; we reviewed each, kept what pinned real behaviour, and validated the suite offline and inside Docker.
Report, slides, README	Claude	Drafted from our measured results; every number cross-checked against the committed artefacts.
Live debugging	Claude	Helped diagnose the Wikipedia User-Agent policy (HTTP 403) and the Windows console encoding crash; both fixes tested live.

Every measured figure in the deliverables comes from runs executed by the team on our own machines. Each module has a primary owner listed above who can walk through and defend it.

Declaration

By signing below, we affirm that the contributions described above are accurate, that the commit shares reflect actual work rather than artificially split commits, that each module has a primary owner who understands and can explain it, and that AI assistant usage has been disclosed as described.
